

Solutions for Service Providers

Alert Logic Threat Manager provides on-demand network security, including intrusion protection, vulnerability management and compliance automation, to help protect networks from threats that bypass perimeter, desktop and server defenses.

Our on-demand Software-as-a-Service (SaaS) platform delivers rapid deployment, zero maintenance and no hardware or software costs. This enables our partners and their customers to be secure and compliant at a fraction of the cost and complexity of traditional products.

Threats Bypass Existing Defenses

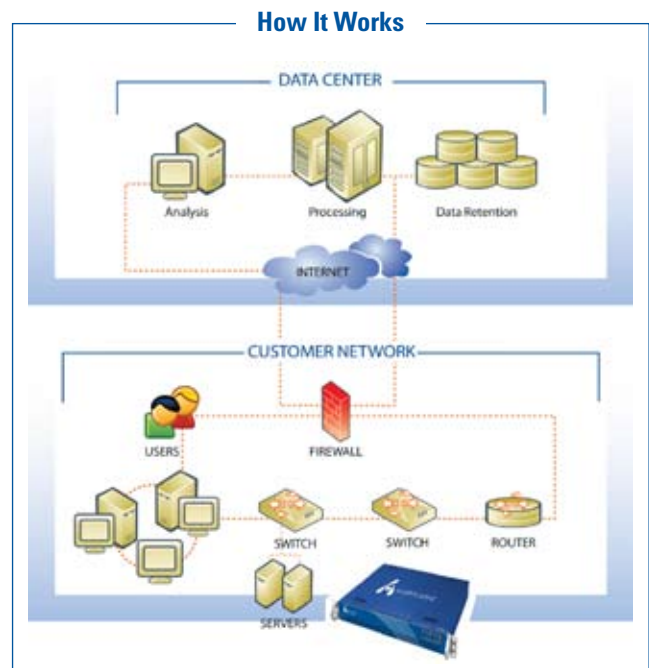

Internal network security breaches remain a significant issue today. According to the recent FBI/CSI Computer Crime and Security Survey, more than 52 percent of organizations continue to experience security breaches, even though over 97 percent have deployed firewall and anti-virus protection. This requires new approaches and additional defenses to improve network security, ensure compliance and meet availability objectives.

To improve security effectiveness, a defense-in-depth network security strategy should be adopted which includes advanced network security technologies such as intrusion detection and prevention. However, many organizations have tried and failed to deploy traditional intrusion protection solutions since they are known to produce an avalanche of false-positives and require constant alert review, tuning and refinement.

Unique Three Layers of Protection

Alert Logic Threat Manager provides three layers of protection through the combination of a network appliance, hosted software and 24x7 Security Operations Center (SOC). With patent-pending 7-factor Threat Scenario Modeling, the solution is highly accurate and effective. Also, with the on-demand three-layered delivery model it is available at an extremely low cost via a monthly subscription.

Alert Logic partners can generate immediate revenue with no up-front investment, no additional staff and no ongoing maintenance burden.

Only Alert Logic Harnesses the Power of software-as-a-service to Deliver Both IT Compliance and Security in one integrated platform.

Solutions for Service Providers

Key Benefits

- **Increases revenue and retention rates** via a completely monitored and managed solution that maximizes both security up-sell and datacenter density, all without up-front capital, infrastructure, or FTE investment.
- **Enables rapid deployment** with no software to install and maintain. This includes a hosted web portal, a fully staffed SOC and a highly flexible virtualized appliance that supports nearly any network architecture.
- **Maximizes sales effectiveness and productivity** with pre-built customer-ready marketing and sales materials designed for quick integration into existing security service offerings.
- **Achieves better network security** with fully integrated intrusion protection, vulnerability management and IT compliance automation.

With the Alert Logic Threat Manager dashboard, you know your security posture at all times.

Key Features

- **Multi-tenant virtualization** protection for up to 50 customer networks in a single 1U appliance while still allowing each customer to manage their security via a private management portal, enabling better data efficiency and higher customer satisfaction.
- **Comprehensive compliance reporting** for PCI, SOX, HIPAA and GLBA, including failed or inappropriate access attempts, configuration exposures and security incidents.
- **Extensive intrusion and vulnerability detection** based on more than 8,000 known threat signatures and 12,000 unique vulnerabilities, with real-time updates supplied automatically.
- **Around-the-clock threat monitoring** by a team of trained SANS, GIAC and CISSP certified analysts who provide 24x7 monitoring for advanced threats.
- **Accurate incident identification** via dynamic network threat ratings based on attack severity and asset aware correlation, such as host criticality, number of active services, number of potential exposures and number of verified vulnerabilities.
- **Attack correlation** of vulnerabilities present on the target host by CVE ID.
- **Successful compromise validation** based on response analysis, payload analysis, correlated event groups and attack patterns (true positive identification).
- **Automated defensive actions** by dynamically configuring existing firewalls and access control devices to shut down confirmed threats.
- **Automated containment actions** by dynamically removing compromised or worm infected hosts from the network, shutting down their switch ports.
