Mission & Alert Logic:
Comprehensive Managed Detection and Response for AWS

For cloud-based businesses across industries, maintaining a strong security posture in a rapidly changing world is more important than ever. With that said, being in the cloud responsibly requires meeting rigorous security and compliance standards and adhering to sound security practices. The degree of vigilance needed to meet these standards, combined with the fast pace of change in technology, makes it impossible for a small internal team to stay current with all of the latest threats. How can your organization balance operational agility with robust security, ultimately protecting against threats in a cost-effective manner? This is where **Mission's Managed Detection and Response (MDR)**, powered by Alert Logic, can help.

Security Built In The Cloud, For The Cloud

With Mission's MDR powered by Alert Logic, Mission's AWS-certified engineers are backed by Alert Logic's industry-leading security analytics, infrastructure, and certified SOC analysts. By leveraging Alert Logic's industry-leading tooling and best-in-class security platform in tandem with Mission's Managed Cloud services, your organization will benefit from a tailored security solution aligned with your compliance requirements, security exposure, and budget.

Fully Managed Threat Detection And Response

Mission's MDR powered by Alert Logic includes:

Identification & notification of critical security issues with a 15-minute SLA.

While the average breach went undetected over 200 days in 2019, our solutions are a managed service that detects and responds to critical issues quickly with a 15-minute SLA so that an attacker does not have time to dwell in your network, seek out vulnerable systems, and exfiltrate your most valuable data.

Remediation of threat and attack conditions tailored to your business needs

Our Mission Managed Detection and Response offering provides a broad range of security, technology, and customer experience professionals assigned to each customer, providing a personalized level of service that considers the context of your organization and role.

Intrusion detection, log analysis and retention

Our managed detection and response services help businesses meet security needs and compliance requirements.

Quarterly AWS security posture reviews with a dedicated security concierge

As your organization expands and market conditions change, your business may have different security needs that affect your AWS security posture. We can assess this based on research, intelligence, and industry standards like CIS Benchmarks to provide insight into your environment on a regular and frequent basis.

Packaged industry-standard CIS AWS Security Reviews, as well as PCI, HIPAA, NIST, SOC-2, and GDPR reporting

With audit-ready reporting, you can be confident in meeting compliance requirements, so you can focus on your business and not spend valuable resources dedicated to compliance reporting and preparing for audits.

User Behavior Anomaly Detection (UBAD) & Reporting

UBAD for AWS environments detects and alerts on suspicious activity, using AWS CloudTrail data, raising incidents for anomalous user behavior which may impact critical assets in your AWS environment.

Best practice guidance on addressing existing and evolving threats, including prioritized remediation recommendations

We provide access to a Global Threat Intelligence team. By tethering your threat detection to an intelligence capability, you are able to identify and react to the most important threats as soon as attackers add them to their arsenal.

Access to all integrated security and threat data through a dedicated and easy-to-use portal

In-depth insights into vulnerabilities, attacker behavior, and validated security incidents are just one click away, so you can visualize your systems and their relationship to each other. This makes it easier to prioritize which area of your environment needs focus to improve security posture.
